

Problem Statement:

While many study methods do exist, there needs to be a way to find out which works best for a person.

Details:

There are lots of different ways to study. Some examples are the Pomodoro study technique, the Feynman technique, and the Leitner system. Some ways work better than others based multiple factors, such as a person's academic ability or their personality. It can take a long time to try and find what works for a person.

Everyone has a study method that works for them, even if they don't know it yet. Not everyone comes into college knowing how to study. Even if someone knows how to study, they might have to change or adjust their study habits to keep their grades up while in college. Anyone who is serious about their grades does not want to go through the trial-and-error process that typically ends with a few bad grades at the start of the semester. By finding the proper study technique early on, students can start their semester off with high grades.
